datasheet (CSP3)

PRODUCT SPECIFICATION

version 2.03

may 2011

To learn more about OmniVision Technologies, visit www.ovt.com.

OmniVision Technologies is publicly traded on NASDAQ under the symbol OVTI.

applications

- cellular phones
- toys
- PC multimedia
- digital still cameras

ordering information

- **OV05640-A71A** (color, lead-free)
71-pin CSP3

features

- 1.4 μm x 1.4 μm pixel with OmniBSI technology for high performance (high sensitivity, low crosstalk, low noise, improved quantum efficiency)
- optical size of 1/4"
- automatic image control functions: automatic exposure control (AEC), automatic white balance (AWB), automatic band filter (ABF), automatic 50/60 Hz luminance detection, and automatic black level calibration (ABLC)
- programmable controls for frame rate, AEC/AGC 16-zone size/position/weight control, mirror and flip, cropping, windowing, and panning
- image quality controls: color saturation, hue, gamma, sharpness (edge enhancement), lens correction, defective pixel canceling, and noise canceling
- support for output formats: RAW RGB, RGB565/555/444, CCIR656, YUV422/420, YCbCr422, and compression
- support for video or snapshot operations
- support for internal and external frame synchronization for frame exposure mode
- support for LED and flash strobe mode
- support for horizontal and vertical sub-sampling, binning
- support for minimizing artifacts on binned image
- support for data compression output
- support for anti-shake
- standard serial SCCB interface
- digital video port (DVP) parallel output interface and dual lane MIPI output interface
- embedded 1.5V regulator for core power
- programmable I/O drive capability, I/O tri-state configurability
- support for black sun cancellation
- support for images sizes: 5 megapixel, and any arbitrary size scaling down from 5 megapixel
- support for auto focus control (AFC) with embedded AF VCM driver
- embedded microcontroller
- suitable for module size of 8.5 x 8.5 x <6mm with both CSP and RW packaging

key specifications (typical)

- **active array size:** 2592 x 1944
- **power supply:**
 - core: 1.5V \pm 5% (with embedded 1.5V regulator)
 - analog: 2.6 ~ 3.0V (2.8V typical)
 - I/O: 1.8V / 2.8V
- **power requirements:**
 - active: 140 mA
 - standby: 20 μA
- **temperature range:**
 - operating: -30°C to 70°C junction temperature (see [table 8-1](#))
 - stable image: 0°C to 50°C junction temperature (see [table 8-1](#))
- **output formats:** 8-/10-bit RGB RAW output
- **lens size:** 1/4"
- **lens chief ray angle:** 24° (see [figure 10-2](#))
- **input clock frequency:** 6~27 MHz
- **max S/N ratio:** 36 dB (maximum)
- **dynamic range:** 68 dB @ 8x gain
- **maximum image transfer rate:**
 - QSXGA (2592x1944): 15 fps
 - 1080p: 30 fps
 - 1280x960: 45 fps
 - 720p: 60 fps
 - VGA (640x480): 90 fps
 - QVGA (320x240): 120 fps
- **sensitivity:** 600 mV/Lux-sec
- **shutter:** rolling shutter / frame exposure
- **maximum exposure interval:** 1964 x t_{ROW}
- **pixel size:** 1.4 μm x 1.4 μm
- **dark current:** 8 mV/s @ 60°C junction temperature
- **image area:** 3673.6 μm x 2738.4 μm
- **package dimensions:** 5985 μm x 5835 μm

5640 CSP D5 1.1

2 system level description

2.1 overview

The OV5640 (color) image sensor is a low voltage, high-performance, 1/4-inch 5 megapixel CMOS image sensor that provides the full functionality of a single chip 5 megapixel (2592x1944) camera using OmniBSI™ technology in a small footprint package. It provides full-frame, sub-sampled, windowed or arbitrarily scaled 8-bit/10-bit images in various formats via the control of the Serial Camera Control Bus (SCCB) interface.

The OV5640 has an image array capable of operating at up to 15 frames per second (fps) in 5 megapixel resolution with complete user control over image quality, formatting and output data transfer. All required image processing functions, including exposure control, gamma, white balance, color saturation, hue control, defective pixel canceling, noise canceling, etc., are programmable through the SCCB interface or embedded microcontroller. The OV5640 also includes a compression engine for increased processing power. In addition, OmniVision image sensors use proprietary sensor technology to improve image quality by reducing or eliminating common lighting/electrical sources of image contamination, such as fixed pattern noise, smearing, etc., to produce a clean, fully stable, color image.

The OV5640 has an embedded microcontroller, which can be combined with an internal autofocus engine and programmable general purpose I/O modules (GPIO) for external autofocus control. It also provides an anti-shake function with an internal anti-shake engine. For identification and storage purposes, the OV5640 also includes a one-time programmable (OTP) memory.

The OV5640 supports both a digital video parallel port and a serial MIPI port.

2.2 architecture

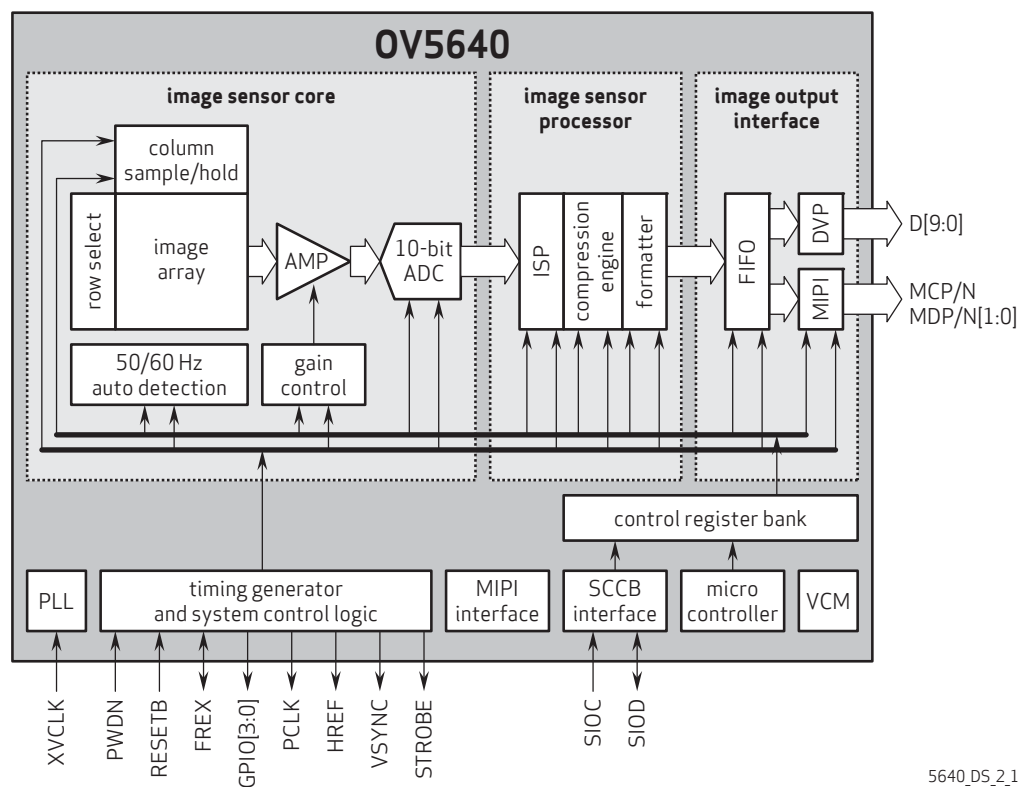

The OV5640 sensor core generates streaming pixel data at a constant frame rate, indicated by HREF and VSYNC.

figure 2-1 shows the functional block diagram of the OV5640 image sensor.

The timing generator outputs signals to access the rows of the image array, precharging and sampling the rows of the array in series. In the time between pre-charging and sampling a row, the charge in the pixels decreases with the time exposed to the incident light. This is known as exposure time.

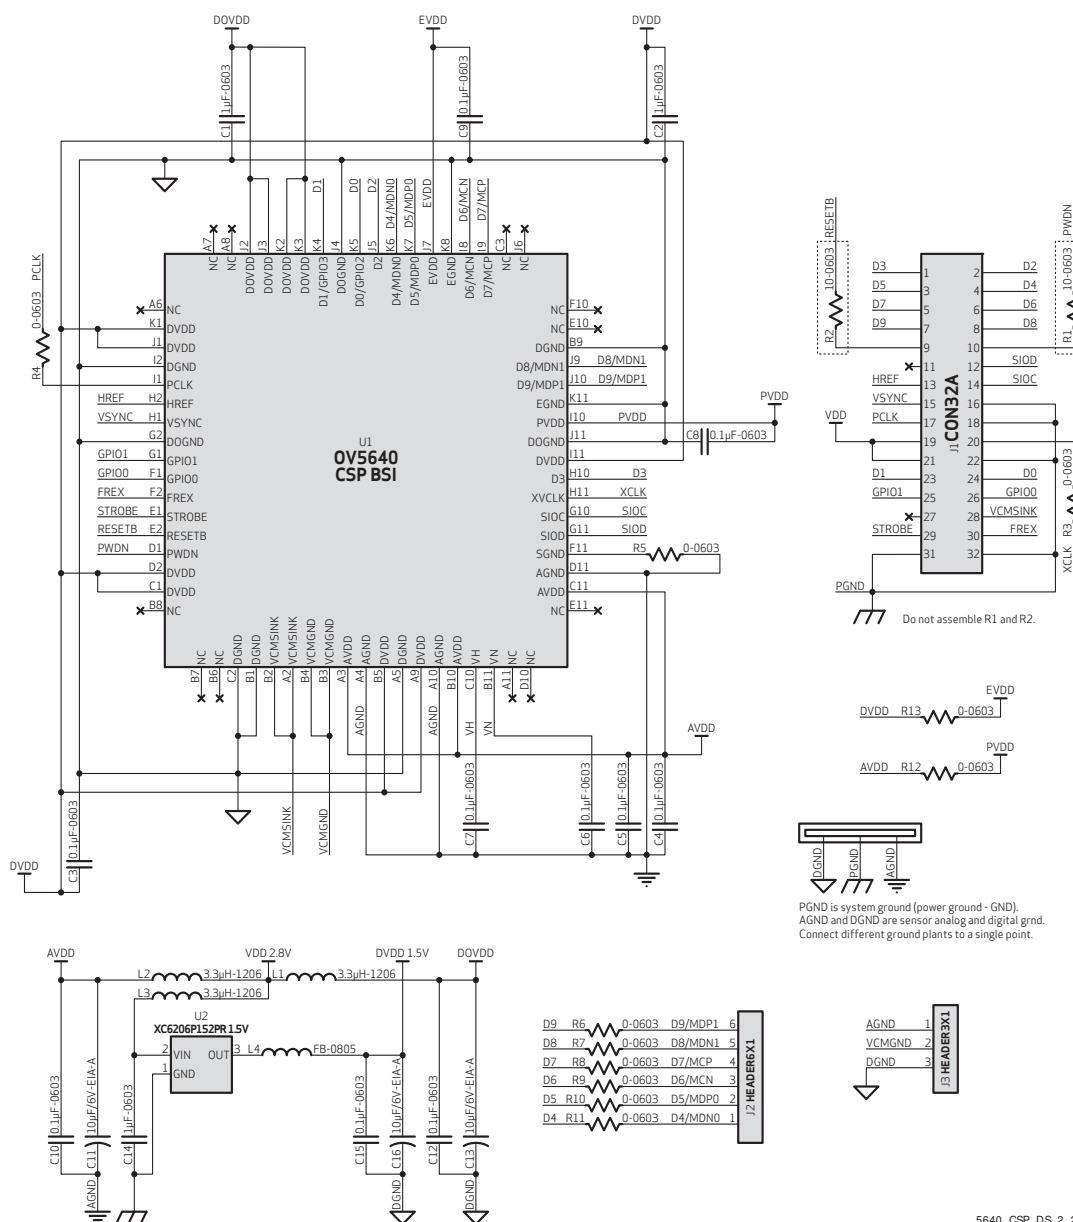

The exposure time is controlled by adjusting the time interval between precharging and sampling. After the data of the pixels in the row has been sampled, it is processed through analog circuitry to correct the offset and multiply the data with corresponding gain. Following analog processing is the ADC which outputs 10-bit data for each pixel in the array.

figure 2-1 OV5640 block diagram

5640_DS_2_1

figure 2-2 reference design schematic

2.3 format and frame rate

table 2-1 format and frame rate

format	resolution	frame rate	scaling method	pixel clock
5 Mpixel	2592x1944	15 fps	full resolution (dummy 16 pixel horizontal, 8 lines) 2608x1952 with dummy	96/192 MHz
1280x960	1280x960	45 fps	subsampling in vertical and horizontal 1296x968 supports 2x2 binning	96/192 MHz
1080p	1920x1080	30 fps	cropping from full resolution 1936x1088 with dummy pixels	96/192 MHz
720p	1280x720	60 fps	cropping 2592x1944 to 2560x1440 subsampling in vertical and horizontal 1296x728 with dummy supports 2x2 binning	96/192 MHz
VGA	640x480	90 fps	subsampling from 1280x960 648x484 with dummy supports 2x2 binning	48/96 MHz
QVGA	320x240	120 fps	subsampling from 1280x960 324x242 with dummy supports 2x2 binning	24/48 MHz

2.4 I/O control

The OV5640 I/O pad direction and driving capability can be easily adjusted. **table 2-2** lists the driving capability and direction control registers of the I/O pads.

table 2-2 driving capability and direction control for I/O pads (sheet 1 of 2)

function	register	default value	R/W	description
output drive capability control	0x302C	0x02	RW	Bit[7:6]: output drive capability 00: 1x 01: 2x 10: 3x 11: 4x

2.5 system clock control

The OV5640 PLL allows for an input clock frequency ranging from 6~27 MHz and has a maximum VCO frequency of 800 MHz. MipiClk is for the MIPI and SysClk is for the internal clock of the Image Signal Processing (ISP) block. The PLL can be bypassed by setting register 0x3039[7] to 1.

2.6 SCCB interface

The Serial Camera Control Bus (SCCB) interface controls the image sensor operation. Refer to the OmniVision Technologies Serial Camera Control Bus (SCCB) Specification for detailed usage of the serial control port.

Group write is supported in order to update a group of registers in the same frame. These registers are guaranteed to be written prior to the internal latch at the frame boundary.

The OV5640 supports up to four groups. These groups share 1 KB RAM and the size of each group is programmable by adjusting the start address. The group hold start addresses range from 0x40 to 0x7F, where the unit is 16 bytes.

table 2-3 group sharing registers

address	register name	default value	R/W	description
0x3200	GROUP ADDR0	0x40	RW	Start Address for Group0 {group_addr0[7:0], 4'h0}
0x3201	GROUP ADDR1	0x4A	RW	Start Address for Group1 {group_addr1[7:0], 4'h0}
0x3202	GROUP ADDR2	0x54	RW	Start Address for Group2 {group_addr2[7:0], 4'h0}
0x3203	GROUP ADDR3	0x5E	RW	Start Address for Group3 {group_addr3[7:0], 4'h0}

The group write function is controlled by register **0x3212**.

table 2-4 group write register

address	register name	default value	R/W	description
0x3212	SRM GROUP ACCESS	—	W	SRM Group Access
				Bit[7]: Group launch enable
				Bit[6]: Test mode access group
				Bit[5]: Group launch
				Bit[4]: Group hold end
				Bit[3:0]: Group id
				0xx: Group for register access
				011: Group to hold register address of embedded line SOF
				100: Group to hold register address of embedded line EOF
				101: Test mode for store register value to memory
0x3213	SRM GROUP STATUS	—	R	110: Test mode for restore register value from memory
				111: Group for write mask address
				SRM Group Status
				Bit[7]: Store default
				Bit[6]: Restore
				Bit[5]: Group hold
				Bit[4]: Group launch
				Bit[3]: Group write
				Bit[2:0]: Group select

The SCCB will enter group write mode after writing to register **0x3212** with a valid group ID. The subsequent registers will be held to the buffer specified by the group_id instead of writing to the registers. Make sure the number of registers does not exceed the capacity of the group. Setting group_hold_end to 1 will exit the group write mode. After that, setting both group_launch and group_launch_en to 1 will write the buffered values to the real registers. Multiple groups of registers can be prepared before writing to the real registers but be sure the correct group_id is specified when the group write is launched.

The following is an example demonstrating the group write operation:

```

78 3212 00 Enable group0
78 3600 00 Write registers to be held in group0
78 3601 01
78 3212 10 End group0

```

78 3212 01 Enable group1
 78 3602 02 Write registers to be held in group1
 78 3603 03
 78 3212 11 End group1

..... Other direct register access

78 3212 02 Enable group2
 78 3604 04 Write registers to be held in group2

 78 3212 13 End group3

78 3212 A1 Launch group1
 78 3212 A2 Launch group2
 78 3212 A3 Launch group3

2.7 power up sequence

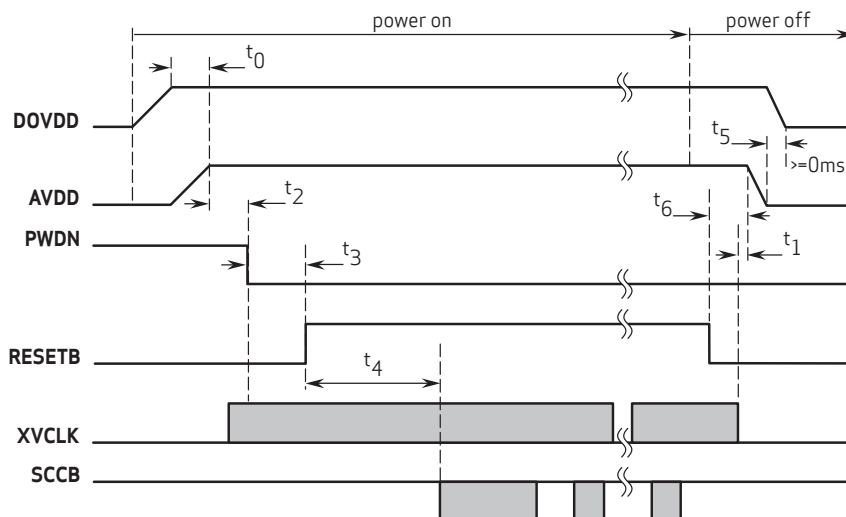

Based on the system power configuration (1.8V or 2.8V for I/O power, using external DVDD or internal DVDD, requiring access to the I2C during power up period or not), the power up sequence will differ. If 1.8V is used for I/O power, using the internal DVDD is preferred. If 2.8V is used for I/O power, due to a high voltage drop at the internal DVDD regulator, there is a potential heat issue. Hence, for a 2.8V power system, OmniVision recommends using an external DVDD source. Due to the higher power down current when using an external DVDD source, OmniVision strongly recommends cutting off all powers, including the external DVDD, when the sensor is not in use in the case of 2.8V I/O and external DVDD.

2.7.1 power up with internal DVDD

For powering up with the internal DVDD and I2C access during the power ON period, the following conditions must occur:

1. when DOVDD and AVDD are turned ON, make sure DOVDD becomes stable before AVDD becomes stable
2. PWDN is active high with an asynchronized design (does not need clock)
3. PWDN pin tied to digital ground if it is not controlled.
4. if PWDN pin is controlled as below, for PWDN to go low, power must first become stable (AVDD to PWDN ≥ 5 ms)
5. RESETB is active low with an asynchronized design
6. master clock XVCLK should provide at least 1 ms before host accesses the sensor's registers
7. host can access I2C bus (if shared) during entire period. 20ms after RESETB goes high, host can access the sensor's registers to initialize sensor

figure 2-3 power up timing with internal DVDD

- note** $t_0 \geq 0\text{ms}$, delay from DOVDD stable to AVDD stable, it is recommended to power up AVDD shortly after DOVDD has been powered up
 $t_1 \geq 0\text{ms}$, delay from XVCLK off to AVDD off
 $t_2 \geq 5\text{ms}$, delay from AVDD stable to sensor power up stable, PWDN can be pulled low after this point, XVCLK can be turned on after power on
 $t_3 \geq 1\text{ms}$, delay from sensor power up stable to RESETB pull up
 $t_4 \geq 20\text{ms}$, delay from RESETB pull high to SCCB initialization
 $t_5 \geq 0\text{ms}$, delay from AVDD off to DOVDD off
 $t_6 \geq 0\text{ms}$, delay from RESETB pull low to AVDD off

5640_DS_2_2

2.7.2 power up with external DVDD source

For powering up with an external DVDD source and I2C access during the power ON period, the following conditions must occur:

1. when DOVDD and AVDD are turned ON, make sure DOVDD becomes stable before AVDD becomes stable
2. when AVDD and DVDD are turned ON, make sure AVDD becomes stable before DVDD becomes stable
3. PWDN is active high with an asynchronized design (does not need clock), PWDN pin tied to digital ground if it is not controlled
4. if PWDN pin is controlled as below, for PWDN to go low, power must first become stable (DVDD to PWDN $\geq 5\text{ms}$)
5. all powers are cut off when the camera is not in use (power down mode is not recommended)
6. RESETB is active low with an asynchronized design
7. master clock XVCLK should provide at least 1 ms before host accesses the sensor's registers
8. host can access I2C bus (if shared) during entire period. 20ms after RESETB goes high, host can access the sensor's registers to initialize sensor

figure 2-4 power up timing with external DVDD source

- note** $t_0 \geq 0$ ms: delay from DOVDD stable to AVDD stable, it is recommended to power up AVDD shortly after DOVDD has been powered up
- $t_1 \geq 0$ ms: delay from AVDD stable to DVDD stable
- $t_2 \geq 5$ ms: delay from DVDD stable to sensor power up stable
- $t_3 \geq 1$ ms, delay from sensor power up stable to RESETB pull up
- $t_4 \geq 20$ ms, delay from RESETB pull high to SCCB initialization
- $t_5 \geq 0$ ms, delay from AVDD off to DOVDD off
- $t_6 \geq 0$ ms, delay from RESETB pull low to DVDD off
- $t_7 \geq 0$ ms, delay from XVCLK off to DVDD off

5640_DS_2_3

2.8 reset

The OV5640 sensor includes a **RESETB** pin that forces a complete hardware reset when it is pulled low (GND). The OV5640 clears all registers and resets them to their default values when a hardware reset occurs. A reset can also be initiated through the SCCB interface by setting register **0x3008**[7] to high.

Manually applying a hard reset upon power up is required even though on-chip reset is included. The hard reset is active low with an asynchronized design. The reset pulse width should be greater than or equal to 1 ms.

2.9 hardware and software standby

Two suspend modes are available for the OV5640:

- hardware standby
- SCCB software standby

To initiate hardware standby mode, the **PWDN** pin must be tied to high (while in MIPI mode, set register 0x300E[4:3] to 2'b11 before the PWDN pin is set to high). When this occurs, the OV5640 internal device clock is halted and all internal counters are reset and registers are maintained.

Executing a software standby through the SCCB interface suspends internal circuit activity but does not halt the device clock. All register content is maintained in standby mode.

OV5640

color CMOS QSXGA (5 megapixel) image sensor with OmniBSI™ technology

3 block level description

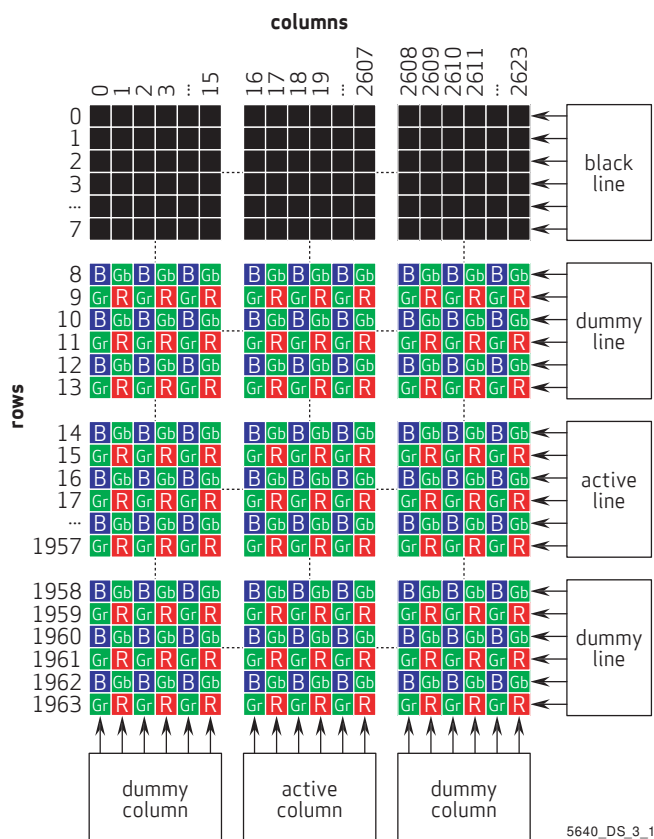

3.1 pixel array structure

The OV5640 sensor has an image array of 2624 columns by 1964 rows (5,153,536 pixels). **figure 3-1** shows a cross-section of the image sensor array.

The color filters are arranged in a Bayer pattern. The primary color BG/GR array is arranged in line-alternating fashion. Of the 5,153,536 pixels, 5,038,848 (2592x1944) are active pixels and can be output. The other pixels are used for black level calibration and interpolation.

The sensor array design is based on a field integration readout system with line-by-line transfer and an electronic shutter with a synchronous pixel readout scheme.

figure 3-1 sensor array region color filter layout

3.2 binning

Binning mode is usually used for subsampling. During subsampling, information is periodically dropped when data is output. When the binning function is ON, voltage levels of adjacent pixels are averaged before being sent to the ADC. If the binning function is OFF, the pixels, which are not output, are merely skipped. The OV5640 supports 2x2, 1x2, and 2x1 binning.

figure 3-2 illustrates 2x2 binning, where the voltage levels of four (2x2) adjacent same-color pixels are averaged before entering the ADC.

In OV5640, vertical binning will automatically turn on when in vertical-subsampled formats.

figure 3-2 example of 2x2 binning

3.3 VCM driver

figure 3-3 VCM block diagram

The maximum SINK current can be estimated as:

- $ISINK = (V_{vcm} - V_{ds}) / (R_s + R_{vcm} + R_{p1} + R_{p2})$
- V_{ds} is the transistor headroom
- R_{p1} and R_{p2} are the resistance in the current path
- R_{VCM} is the resistance of the voice coil motor.

The OV5640 VCM driver is a single 10-bit DAC with 100 mA output current sink capability. It is designed for linear control of the VCM. The DAC is controlled via the SCCB interface with clock rates up to 400 Hz. The OV5640 VCM driver provides three types of output current control modes that allow users to adjust transient response of the sinking current.

3.3.1 output current control mode

The OV5640 VCM driver uses 4 bits (S3, S2, S1, and S0) to control the output current response.

1. $S[3:0] = X000$: Directly jump mode: code directly jumps to target code. Output current transient response time (see [table 3-2](#).)
2. $S[3:0] = 0001$ to 0111 : Single step mode: code increases/decreases by a single step. Single step time durations are 50μs, 100μs, 200μs, 400μs, 800μs, 1600μs, and 3200μs, which are controlled by S2, S1, and S0 (see [table 3-4](#).)
3. $S[3:0] = 1001$ to 1111 : Multi-code steps mode: Code increases/decreases in multi-code steps. If the target code and the current code have a difference larger than 128, the 64-code step is applied first. When the difference in between target and current codes is no more than 128 but larger than 16, the 16-code step is used. When the difference is less than 16, it will directly jump to the target code. Single step time options are 50μs, 100μs, 200μs, 400μs, 800μs, 1600μs, and 3200μs, which are controlled by S2, S1, and S0, (see [table 3-5](#).)

4 image sensor core digital functions

4.1 mirror and flip

The OV5640 provides Mirror and Flip readout modes, which respectively reverse the sensor data readout order horizontally and vertically (see **figure 4-1**). In flip, the OV5640 does not need additional settings because the ISP block will auto-detect whether the pixel is in the red line or blue line and make the necessary adjustments.

figure 4-1 mirror and flip samples

4.2 image windowing

The OV5640 uses registers 0x3800 ~ 0x3814 for image windowing. **figure 4-2** illustrates how the registers define the windowing size. Physical pixel size is the total pixel array size we have in the sensor. The ISP input size is the total pixel data read from pixel array. Typically, the larger ISP input size is, the less maximum frame rate can be reached. The data output size is the image output size of OV5640. This size is windowed from ISP input size and is defined by x_offset and y_offset as **figure 4-2** shows.

figure 4-2 image windowing

5640_DS_4_2

figure 4-3 shows the windowing configuration when scaling function is enabled. The pre-scaling image size is the ISP input size subtracted by two times of offsets for both horizontal and vertical.

figure 4-3 image windowing configuration

4.4 50/60Hz detection

4.4.1 overview

When the integration time is not an integer multiple of the period of light intensity, the image will flicker. The function of the detector is to detect whether the sensor is under a 50 Hz or 60 Hz light source so that the basic step of integration time can be determined. Contact your local OmniVision FAE for auto detection settings.

4.5 AEC/AGC algorithms

4.5.1 overview

The Auto Exposure Control (AEC) and Auto Gain Control (AGC) allows the image sensor to adjust the image brightness to a desired range by setting the proper exposure time and gain applied to the image. Besides automatic control, exposure time and gain can be set manually from external control. The related registers are listed in **table 4-4**.

table 4-4 AEC/AGC control functions

address	register name	default value	R/W	description
0x3500	AEC PK EXPOSURE	0x00	RW	Exposure Output Bit[3:0]: Exposure [19:16]
0x3501	AEC PK EXPOSURE	0x02	RW	Exposure Output Bit[7:0]: Exposure [15:8]
0x3502	AEC PK EXPOSURE	0x00	RW	Exposure Output Bit[7:0]: Exposure [7:0] Lower four bits are a fraction of a line; they should be 0 since OV5640 does not support fraction line exposure

0x350D	AEC PK VTS	0x00	RW	AEC VTS Output Bit[7:0]: VTS[7:0] low bits

4.5.2 average-based algorithm

The average-based AEC controls image luminance using registers (0x3A0F), (0x3A10), (0x3A1B), and (0x3A1E). In average-based mode, the value of register (0x3A0F) indicates the high threshold value, and the value of register (0x3A10) indicates the low threshold value. The value of register (0x3A1B) indicates the high threshold value for image change from stable state to unstable state and the value of register (0x3A1E) indicates the low threshold value for image change from stable state to unstable state. When the target image luminance average value AVG READOUT (0x56A1)

is within the range specified by registers (0x3A1B) and (0x3A1E), the AEC keeps the image exposure and gain. When register AVG READOUT (0x56A1) is greater than the value in register (0x3A1B), the AEC will decrease the image exposure and gain until it falls into the range of {0x3A10, 0x3A0F}. When register AVG READOUT (0x56A1) is less than the value in register (0x3A1E), the AEC will increase the image exposure and gain until it falls into the range of {0x3A10, 0x3A0F}. Accordingly, the value in register (0x3A0F) should be greater than the value in register (0x3A10). The gap between the values of registers (0x3A1B) and (0x3A1E) controls the image stability.

The AEC function supports both manual and auto speed selections in order to bring the image exposure into the range set by the values in registers (0x3A0F) and (0x3A10). For manual mode, the speed supports both normal and fast speed selection. AEC set to normal mode will allow for the slowest step increment or decrement in the image exposure to maintain the specified range. AEC set to fast mode will provide for an approximate ten-step increment or decrement in the image exposure to maintain the specified range. For auto mode, the speed step will automatically be adjusted according to the difference between the target and present values. The auto ratio of steps can be set by register bits AVG READOUT (0x56A1); thus, the AEC speed can be adjusted automatically by the image average value or controlled manually.

Register (0x3A11) and register (0x3A1F) controls the fast AEC range in manual speed selection made. If the target image AVG READOUT (0x56A1) is greater than (0x3A11), AEC will decrease by half. If register AVG READOUT (0x56A1) is less than (0x3A1F), AEC will double.

As shown in desired convergence, the AEC/AGC convergence uses two regions, the inner stable operating region and the outer control zone, which defines the convergence step size of fast and slow conditions.

figure 4-5 desired convergence

5640_DS_4_4

As for auto mode, the AEC will automatically calculate the steps needed based on the difference between target and current values. So, the outer control zone is meaningless for this mode.

For the average-based AEC/AGC algorithm, the measured window is horizontally and vertically adjustable and divided by sixteen (4x4) zones (see [figure 4-6](#)). Each zone (or block) is 1/16th of the image and has a 4-bit weight in calculating the average luminance (YAVG). The 4-bit weight could be $n/16$ where n is from 0 to 15. The final YAVG is the weighted average of the sixteen zones.

4.5.2.1 average luminance (YAVG)

Auto exposure time calculation is based on a frame brightness average value. By properly setting `x_start`, `x_end`, `y_start`, and `y_end` as shown in [figure 4-6](#), a 4x4 grid average window is defined. It will automatically divide each zone into 4x4 zones. The average value is the weighted average of the 16 sections. [table 4-6](#) lists the corresponding registers.

figure 4-6 average-based window definition

4.6 AEC/AGC steps

The AEC and AGC work together to obtain adequate exposure/gain based on the current environmental illumination. In order to achieve the best SNR, extending the exposure time is always preferred rather than raising the gain when the current illumination is getting brighter. Vice versa, under dark conditions, the action to decrease the gain is always taken prior to shortening the exposure time.

4.6.1 auto exposure control (AEC)

The function of the AEC is to calculate the integration time of the next frame and send the information to the timing control block. Based on the statistics of previous frames, the AEC is able to determine whether the integration time should increase, decrease, fast increase, fast decrease, or remain the same.

To avoid image flickering under a periodic light source, the integration time can be adjusted in steps of integer multiples of the period of the light source. This new AEC step system is called the banding filter, suggesting that the exposure time is not continuous but falls in some steps.

4.6.1.1 banding mode ON with AEC

In Banding ON mode, the exposure time will fall in steps of integer multiples of the period of light intensity. This design is to reject image flickering when the light source is not steady but periodical.

For a given light flickering frequency, the band step can be expressed in units of row period.

Band Step = 'period of light intensity' × 'frame rate' × 'rows per frame'.

The band steps for 50Hz and 60Hz light sources can be set in registers {0x3A08[1:0], 0x3A09[7:0]} and {0x3A0A[1:0], 0x3A0B[7:0]}, respectively.

When auto-banding is ON, if the next integration time is less than the minimum band step, banding will automatically turn OFF. It will turn ON again when the next integration time becomes larger than the minimum band. If auto banding is disabled, the minimum integration time is one band step. Auto banding can be set in register bit 0x3A00[5].

4.6.1.2 banding mode OFF with AEC

When banding mode is OFF, integration time increases/decreases as normal. It is not necessarily multiples of band steps.

4.6.1.3 night mode

The OV5640 supports long integration time such as 1 frame, 2 frames, 3 frames, 4 frames, 5 frames, 6 frames, 7 frames, and 8 frames in dark conditions. This is achieved by slowing down the original frame rate and waiting for exposure. Night mode ceiling can be set in register bits {0x3A02[7:0], 0x3A03[7:0], 0x3A14[7:0], 0x3A15[7:0]}. Night mode can be disabled by setting register bit 0x3A00[2] to 0. Also, when in night mode, the increase and decrease step can be based on band or frames, depending on register 0x3A05[6]. The minimum increase/decrease step can be one band. The step can be based both on bands and frames.

4.6.2 manual exposure control

To manually change exposure value, you must first set both 0x3503[0], where 0x3503[0] enables manual exposure control. In auto exposure mode, the extra exposure values (larger than 1 frame) in registers 0x350C/0x350D automatically change. In manual exposure mode, these registers will not automatically change. The manually set

exposure in registers 0x3500~0x3502 must be less than the maximum exposure value in {0x380E, 0x380F} + {0x350C, 0x350D}. The exposure value in registers 0x3500~0x3502 is in units of line*16 - the low 4 bits (0x3502[3:0]) is the fraction of line, the maximum value in {0x380E + 0x380F} + {0x350C, 0x350D} is in unit of line. If the manually set exposure value is less than one pre-defined frame period (e.g., 1/15 second in 15fps), there is no need to change 0x380E/0x380F. If the exposure value needs to be set beyond the pre-defined frame period; in other words, if the frame period needs to be extended to extend exposure time, then the maximum frame value in 0x380E/0x380F needs to be set first, then the exposure can be set in registers 0x3500~0x3502 accordingly.

4.6.3 auto gain control (AGC)

Unlike prolonging integration time, increasing gain will amplify both signal and noise. Thus, AGC usually starts after AEC is full. However, in cases where adjacent AEC step changes are too large ($>1/16$), AGC steps should be inserted in between; otherwise, the integration time will keep switching between two adjacent steps and the image flickers.

4.6.3.1 integration time between 1~16 rows

When integration time is less than 16 rows, the changes between adjacent AEC steps are larger than $1/16$, which may possibly make the image oscillate between two AEC levels; thus, some AGC steps are added in between.

4.6.3.2 gain insertion between AEC banding steps

When banding mode is ON, the integration time changes in step of the period of light intensity. For the first 16 band steps, since the exposure time change between adjacent steps is larger than $1/16$, AGC steps are inserted to ensure image stability.

4.6.3.3 gain insertion between night mode steps

Between night mode steps (e.g., integration time = 1 frame and 2 frames), AGC steps are inserted to ensure no adjacent step change is larger than $1/16$.

4.6.3.4 when AEC reaches maximum

When AEC reaches its maximum step while the image is still too dark, the gain starts to increase until the new frame average falls into the stable range or AGC reaches its maximum step. The AGC ceiling can be set in {0x3A18[9:8], 0x3A19[7:0]}.

4.6.4 manual gain control

To manually change gain, first set register bit 0x3503[1] to enable manual control, then change the values in 0x350A/0x350B for the manual gain. The OV5640 has a maximum of 64x gain.

4.7 black level calibration (BLC)

The pixel array contains several optically shielded (black) lines. These lines are used as reference for black level calibration. There are three main functions of the BLC:

- Combining two ADC data paths into one data path
- Adjusting all normal pixel values based on the values of the black levels
- Applying multiplication to all pixel values based on digital gain

Black level adjustments can be made with registers 0x4000 through 0x4013.

table 4-7 BLC control functions

address	register name	default value	R/W	description

0x4009	BLACK LEVEL	0x10	RW	Bit[7:0]:	BLC black level target at 10-bit range

4.8 light frequency selection

The OV5640 can detect the light flickering frequency. When this function is enabled, the sensor can detect the light frequency and select the corresponding banding filter value. To remove banding, the banding filter should be turned on and the banding filter value should be set to the appropriate value.

table 4-8 light frequency registers

address	register name	default value	R/W	description	
0x3C01	5060HZ_CTRL1	0x00	RW	Bit[7]:	Band manual enable 0: Auto 1: Manual
0x3C00	5060HZ_CTRL2	0x00	RW	Bit[2]:	Band value manual setting 0: 60 Hz light 1: 50 Hz light
0x3C0C	5060HZ_CTRL3	—	R	Bit[0]:	Band50/60 0: 60 Hz light 1: 50 Hz light

4.9 digital gain

The OV5640 supports 1/2/4 digital gain. Normally, the gain is controlled automatically by the automatic gain control (AGC) block.

4.10 strobe flash and frame exposure

4.10.1 strobe flash control

The strobe signal is programmable. It supports both LED and Xenon modes. The polarity of the pulse can be changed. The strobe signal is enabled (turned high/low depending on the pulse's polarity) by requesting the signal via the SCCB interface. Flash modules are triggered by the rising edge by default or by the falling edge if the signal polarity is changed. It supports the following flashlight modes (see [table 4-9](#)).

table 4-9 flashlight modes

mode	output	AEC / AGC	AWB
xenon	one-pulse	no	no
LED 1	pulse	no	no
LED 2	pulse	no	yes
LED 3	continuous	yes	yes

4.10.1.1 xenon flash control

After a strobe request is submitted, the strobe pulse will be activated at the beginning of the third frame (see [figure 4-7](#)). The third frame will be correctly exposed. The pulse width can be changed in Xenon mode between 1H and 4H, depending on register 0x3B00[3:2], where H is one row period.

figure 4-7 xenon flash mode

4.10.1.2 LED 1 & 2 mode

Two frames after the strobe request is submitted, the third frame is correctly exposed. The strobe pulse will be activated only one time if the strobe end request is set correctly (see [figure 4-8](#)). If end request is not sent, the strobe signal is activated intermittently until the strobe end request is set (see [figure 4-9](#)). The number of skipped frames is programmable using registers {0x3A1C, 0x3A1D}.

figure 4-8 LED 1 & 2 mode - one pulse output

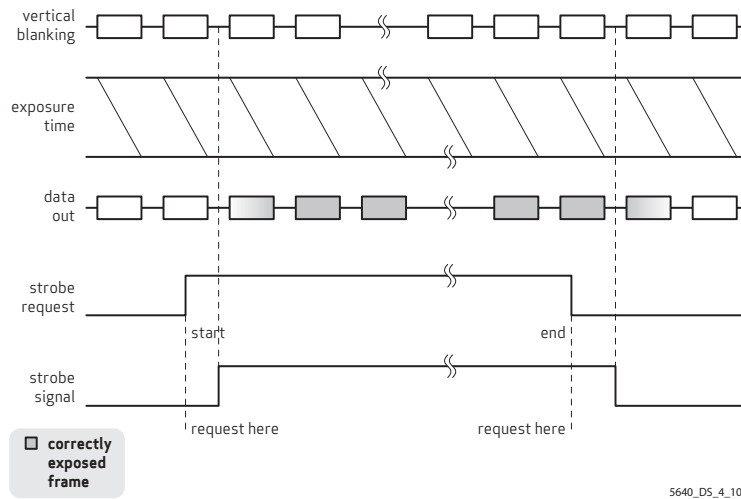

figure 4-9 LED 1 & 2 mode - multiple pulse output

4.10.1.3 LED 3 mode

In LED 3 mode, the strobe signal stays active until the strobe end request is sent (see [figure 4-10](#)).

figure 4-10 LED 3 mode

4.10.2 frame exposure (FREX) mode

In FREX mode, whole frame pixels start integration at the same time, rather than integrating row by row. After the user-defined exposure time (registers {0x3B04, 0x3B05}), the shutter closes, preventing further integration and the image begins to read out. After the readout finishes, the shutter opens again and the sensor resumes normal mode, waiting for the next FREX request.

The OV5640 supports two modes of FREX (see [figure 4-11](#)):

- mode 1 - frame exposure and shutter control requests come from the external system via the FREX pin. The sensor will send a strobe output signal to control the flash light.
- mode 2 - frame exposure request comes from the external system via the I2C register 0x3B08[0]. The sensor will output two signals, shutter control signal through the FREX pin and strobe signal through the STROBE pin.

figure 4-11 FREX modes

In mode 1, the FREX pin is configured as an input while it is configured as an output in mode 2. In both mode 1 and mode 2, the strobe output is irrelevant with the rolling strobe function. When in rolling shutter mode, the strobe function and this FREX/shutter control function do not work at the same time.

4.10.3 FREX strobe flash control

See **table 4-10** for FREX strobe control functions.

- a. AVDD must be $2.1V \pm 5\%$ when writing/programming OTP, otherwise there will be reliability issues. There is no such limitation when reading OTP under normal operating conditions.
- b. 0x3D00~0x3D04 are reserved for omnivision internal use only

5 image sensor processor digital functions

5.1 ISP general controls

The ISP module provides lens correction, gamma, de-noise, sharpen, auto focus, etc. These functions are enabled by registers 0x5000 ~ 0x5005.

table 5-1 ISP general control registers (sheet 1 of 3)

5.2 lens correction (LENC)

The main purpose of the LENC is to compensate for lens imperfection. According to the area where each pixel is located, the module calculates a gain for the pixel, correcting each pixel with its gain calculated to compensate for the light distribution due to lens curvature. The LENC correcting curve automatic calculation according sensor gain is also added so that the LENC can adapt with the sensor gain. Also, the LENC supports the subsample function in both horizontal and vertical directions. Contact your local OmniVision FAE for lens correction settings (registers 0x5800~0x5849).

5.3 auto white balance (AWB)

The main function of Auto White Balance (AWB) is the process of removing unrealistic color casts so that objects which appear white in person are rendered white in the image or video. Thus, the AWB makes sure that the white color is always a white color in different color temperatures. It supports manual white balance and auto white balance. For auto white balance, simple AWB and advanced AWB methods are supplied. Advance AWB takes into account the *color temperature* of a light source. For advanced AWB settings, contact your local OmniVision FAE.

5.4 raw gamma

The main purpose of the Gamma (GMA) function is to compensate for the non-linear characteristics of the sensor. GMA converts the pixel values according to the Gamma curve to compensate the sensor output under different light strengths. The non-linear gamma curve is approximately constructed with different linear functions. Raw gamma compensates the image in the RAW domain.

table 5-4 raw gamma control registers

address	register name	default value	R/W	description

5.5 defect pixel cancellation (DPC)

Due to processes and other reasons, pixel defects in the sensor array will occur. Thus, these bad or wounded pixels will generate wrong color values. The main purpose of Defect Pixel Cancellation (DPC) function is to remove the effect caused by these bad or wounded pixels. Also, some special functions are available for those pixels located at the image boundary. To remove the defect pixel effect correctly, the proper threshold should first be determined.

table 5-5 DPC control registers

address	register name	default value	R/W	description
0x5000	ISP CONTROL 00	0x06	RW	Bit[2]: Black pixel cancellation enable 0: Disable 1: Enable Bit[1]: White pixel cancellation enable 0: Disable 1: Enable

5.6 color interpolation (CIP)

The CIP functions include de-noising of raw images, RAW to RGB interpolation, and edge enhancement. In sensor RAW format, each pixel will be either R, G or B. CIP will calculate the other two color values using the neighboring pixel of the same color. Thus, we can get the full RGB information for each pixel. For edge enhancement, the OV5640 provides both manual and auto modes.

table 5-6 CIP control registers

5.7 color matrix (CMX)

The main purpose of the Color Matrix (CMX) function is to cancel out crosstalk and convert color space. Given the color correction matrix, CCM, and RGB to YUV conversion matrix, RGB2YUV, the combined matrix is:

$$\text{CMX} = \begin{bmatrix} \text{cmx00} & \text{cmx01} & \text{cmx02} \\ \text{cmx10} & \text{cmx11} & \text{cmx12} \\ \text{cmx20} & \text{cmx21} & \text{cmx22} \end{bmatrix} = \text{RGB2YUV} \times \text{CCM} \times \begin{bmatrix} 1 & -0.25 & 0.75 \\ 1 & -0.25 & -0.25 \\ 1 & 0.75 & -0.25 \end{bmatrix}$$

$$\text{where } \begin{bmatrix} R \\ G \\ B \end{bmatrix} = \text{CCM} \begin{bmatrix} R_0 \\ G_0 \\ B_0 \end{bmatrix}$$

The CMX is then normalized by $2^{0x5394[3:0]}$.

table 5-7 CMX control registers (sheet 1 of 2)

5.8 UV average

The main function of the UV average is to average the U/V channel value using special filters.

table 5-8 UV average register

address	register name	default value	R/W	description
0x5001	ISP CONTROL 01	0x4F	RW	Bit[2]: UV average enable 0: Disable 1: Enable

5.9 scaling

The main purpose of the scaling function is to zoom out the image. According to the new width and new height of the new image, the module uses the values of several pixels to generate the values of one pixel. The values of some pixels are divided and used in two or more adjacent pixels. The scaling function supports up to 32x scale.

table 5-9 UV average register (sheet 1 of 2)

5.10 UV adjust

The main function of the UV adjust is to adjust the U/V channel value according to sensor gain. It supports both manual and auto modes.

The UV adjust function is integrated in SDE. The main function of the UV adjust is to adjust the U/V channel value according to sensor gain. It supports both manual and auto modes

5.10.1 manual mode

By setting SDE CTRL 0 [1] (0x5580) to 1 and SDE CTRL 8 0x5588[6] to 1, UV adjust is controlled only by register SAT U (0x5583[7:0] and SAT V (0x5584[7:0]) for U and V gains.

5.10.2 auto mode

When the UV adjust is set for auto mode(0x5580[1]=1 and 0x5588[6]=0), the UV adjust curve parameters (see **figure 5-1**) should be entered into the corresponding registers. The UV adjust parameters, UV adj th1, UV adj th2, and offset low, offset high should be entered into the registers to set the curve. To get these values, first set the values of UV adj th1, UV adj th2, offset low and offset high. Then, calculate the values of a and k as follows:

$$k = (\text{offset high} - \text{offset low}) / (\text{UV adj th2} - \text{UV adj th1})$$

$$a = \text{offset high} + (\text{offset high} - \text{offset low}) / (\text{UV adj th2} - \text{UV adj th1})$$

Registers to be changed:

- UV adj th1[8:0] = registers 0x5589[7:0]
- UV adj th2[8:0] = registers {0x558A[0], 0x558B[7:0]}
- offset high = register 0x5583[7:0] (when 0x5580[1]=1 and 0x5588[6]=0)
- offset low = register 0x5584[7:0] (when 0x5580[1]=1 and 0x5588[6]=0)

figure 5-1 UV adjust graph

5.11 special digital effects (SDE)

The Special Digital Effects (SDE) functions include hue/saturation control, brightness, contrast, etc. SDE also supports negative, black/white, sepia, greenish, blueish, redish, solarize and other image effects.

table 5-10 SDE control registers

6.1 compression engine

6.1.1 compression mode 1 timing

The whole frame has only one line. PCLK will be gated when there is no valid image data transmitted.

figure 6-1 compression mode 1 timing

6.1.2 compression mode 2 timing

Compression data is transmitted with programmable line width. PCLK is free running. The last line may contain dummy data to match the width. By default, the line number varies from frame to frame. The user can set register 4600[5] (0x4600) to ensure every frame has a fixed line number (programmable).

figure 6-2 compression mode 2 timing

6.1.3 compression mode 3 timing

Compression data is transmitted with programmable width. The last line width maybe different from the other line (there is no dummy data). In each frame, the line number may be different.

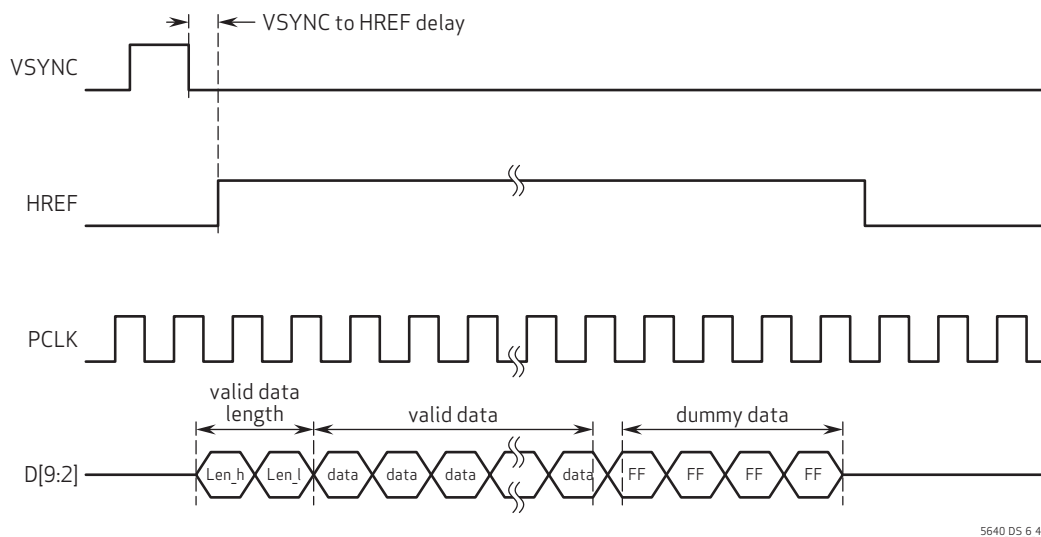

figure 6-3 compression mode 3 timing

6.1.4 compression mode 4 timing

The width and height are fixed in each frame. The first two bytes are valid data length in every line, followed by valid image data. Dummy data (0xFF) may be used as padding at each line end if the current valid image data is less than the line width.

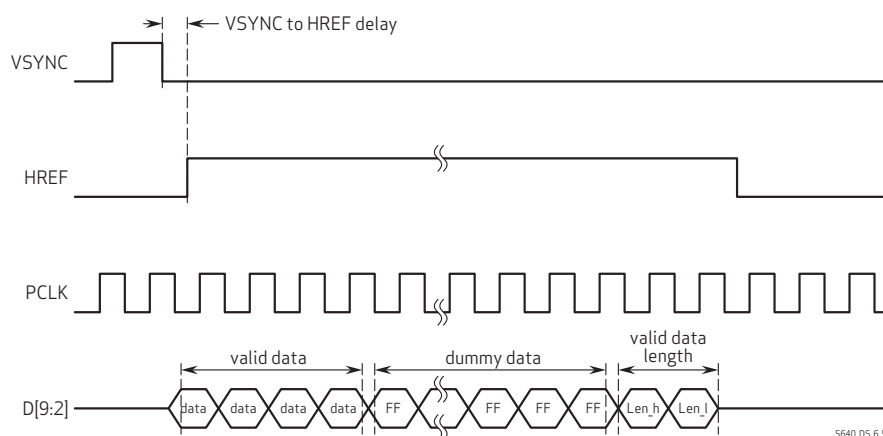

figure 6-4 compression mode 4 timing

6.1.5 compression mode 5 timing

The width and height are fixed in each frame. Every line begins with valid image data. Dummy data may be used as padding at each line end if the current valid image data is less than the line width. The last two bytes of every line is valid data length.

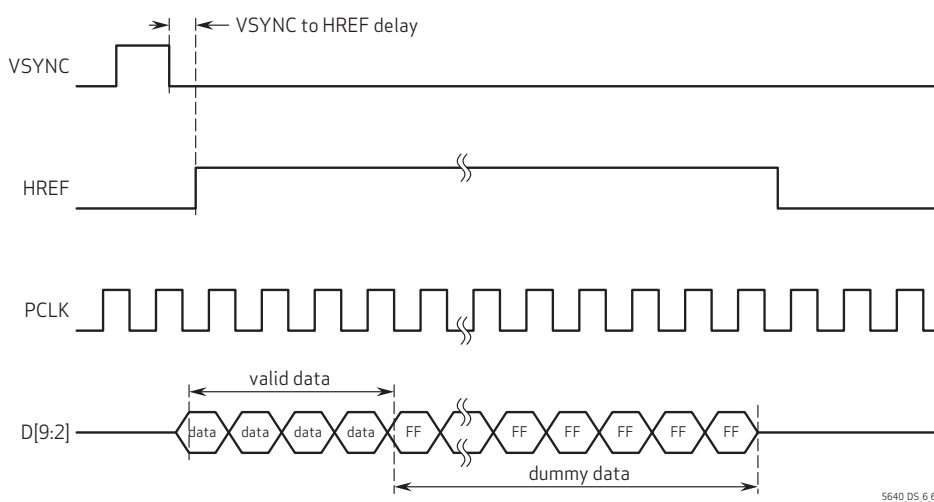

figure 6-5 compression mode 5 timing

6.1.6 compression mode 6 timing

The width and height are fixed in each frame. Every line begins with valid image data. Dummy data may be used as padding at each line end if the current valid image data less than the line width.

figure 6-6 compression mode 6 timing

6.1.7 compression mode control

table 6-1 compression control registers (sheet 1 of 2)

address	register name	default value	R/W	description

0x3039	SC PLL CONTRL 5	0x00	RW	Bit[7]: PLL bypass

6.3 microcontroller unit (MCU)

The MCU firmware can be downloaded by writing to registers starting from 0x8000. A total of 4 KB of program memory can be used for program storage. Before downloading the firmware, the user must enable the MCU clock by setting register 0x3000[5] to 1'b1. After downloading the firmware, set register 0x3000[5] to 1'b0 to enable the MCU. The MCU interrupts are triggered by several internal signals for firmware development.

table 6-3 MCU control registers (sheet 1 of 2)

address	register name	default value	R/W	description	
0x3F00	MC CTRL 00	0x00	RW	Bit[0]:	MCU soft reset 1: Reset MCU
0x3F01	MC INTERRUPT MASK0	0x00	RW	Mask0 for Interrupt (0: disable interrupt bit; 1: enable interrupt bit) Bit[7]: JFIFO over flow Bit[6]: JFIFO end of image Bit[5]: ISP end of frame Bit[4]: ISP start of frame Bit[3]: AFC done Bit[2]: AWB done Bit[1]: VFIFO full Bit[0]: VFIFO empty	
0x3F02	MC INTERRUPT MASK1	0x00	RW	Mask1 for Interrupt (0: disable interrupt bit; 1: enable interrupt bit) Bit[7]: AEC done Bit[6]: ISP average done Bit[5]: AEC trigger Bit[4]: JPG over size Bit[3]: SRM operation start Bit[2]: SRM operation done Bit[1]: DVP frame counter change Bit[0]: BLC start of frame	
0x3F03	MC READ INTERRUPT ADDRESS	0x70	RW	Bit[7:0]:	Set high byte for SCCB address that will trigger interrupt when read
0x3F04	MC READ INTERRUPT ADDRESS	0x00	RW	Bit[7:0]:	Set low byte for SCCB address that will trigger interrupt when read
0x3F05	MC WRITE INTERRUPT ADDRESS	0x70	RW	Bit[7:0]:	Set high byte for SCCB address that will trigger interrupt when written
0x3F06	MC WRITE INTERRUPT ADDRESS	0x04	RW	Bit[7:0]:	Set low byte for SCCB address that will trigger interrupt when written

table 6-3 MCU control registers (sheet 2 of 2)

address	register name	default value	R/W	description
0x3F0C	MC INTERRUPT0 STATUS	0x00	RW	Interrupt0 Status Indicator Bit[5]: ISP EOF Bit[4]: ISP SOF Bit[2]: AWB done Bit[1]: VFIFO full Bit[0]: VFIFO empty
0x3F0D	MC INTERRUPT1 STATUS	0x00	RW	Interrupt1 Status Indicator Bit[7]: AEC done Bit[6]: Average done Bit[5]: AEC trigger Bit[3]: MIPI turn around Bit[2]: MIPI low power contention detect Bit[0]: BLC SOF

6.4 frame control (FC)

Frame control (FC) is used to mask some specified frame by setting the appropriate registers.

table 6-4 FC control registers

address	register name	default value	R/W	description
0x4201	FRAME CONTROL 00	0x00	RW	Control Passed Frame Number When both ON and OFF numbers are set to 0x00, frame control is in bypass mode Bit[3:0]: Frame ON number
0x4202	FRAME CONTROL 01	0x00	RW	Control Masked Frame Number When both ON and OFF numbers are set to 0x00, frame control is in bypass mode Bit[3:0]: Frame OFF number

6.5 format description

Format control converts the internal data format into the desired output format including YUV, RGB, or RAW.

table 6-5 **FORMAT control registers (sheet 1 of 5)**

address	register name	default value	R/W	description
				Format Control 00
				Bit[7:4]: Output format of formatter module

6.6 digital video port (DVP)

6.6.1 overview

The Digital Video Port (DVP) provides 10-bit parallel data output in all formats supported and extended features including compression mode, HSYNC mode, CCIR656 mode, and test pattern output. The DVP is also used to receive the video data from an external camera, which will be sent out through the OV5640 MIPI interface.

table 6-6 DVP control registers (sheet 1 of 3)

address	register name	default value	R/W	description
0x4709	DVP VYSNC WIDTH0	0x02	RW	VSYNC Width Line Unit
0x470A	DVP VYSNC WIDTH1	0x00	RW	Bit[7:0]: VSYNC width PCLK unit[15:8]

6.7 mobile industry processor interface (MIPI)

MIPI provides a single uni-directional clock lane and two bi-directional data lane solution for communication links between components inside a mobile device. The two data lanes have full support for HS (uni-direction) and LP (bi-direction) data transfer mode. Contact your local OmniVision FAE for more details.

table 6-8 MIPI transmitter registers (sheet 1 of 3)

address	register name	default value	R/W	description
0x4800	MIPI CTRL 00	0x04	RW	MIPI Control 00
				Bit[5]: Clock lane gate enable 0: Clock lane is free running 1: Gate clock lane when no packet to transmit
				Bit[4]: Line sync enable 0: Do not send line short packet for each line 1: Send line short packet for each line
				Bit[3]: Lane select 0: Use lane1 as default data lane 1: Use lane2 as default data lane
				Bit[2]: Idle status 0: MIPI bus will be LP00 when no packet to transmit 1: MIPI bus will be LP11 when no packet to transmit
0x4801	MIPI CTRL 01	0x04	RW	MIPI Control 01
				Bit[4]: PH bit order for ECC 0: {DI[7:0],WC[7:0],WC[15:8]} 1: {DI[0:7],WC[0:7],WC[8:15]}
				Bit[3]: PH byte order for ECC 0: {DI,WC_l,WC_h} 1: {DI,WC_h,WC_l}
0x4805	MIPI CTRL 05	0x10	RW	Bit[2]: PH byte order2 for ECC 0: {DI,WC} 1: {WC,DI}
				Bit[7]: MIPI lane1 disable 1: Disable MIPI data lane1 Lane1 will be LP00
				Bit[6]: MIPI lane1 disable 1: Disable MIPI data lane1 Lane1 will be LP00
				Bit[5]: LPX Global timing select 0: Auto calculate t_lpx_o in pclk2x domain, unit clk2x 1: Use lp_p_min[7:0]

7 register tables

The following tables provide descriptions of the device control registers contained in the OV5640. For all registers enable/disable bits, ENABLE = 1 and DISABLE = 0.

7.1 system and IO pad control [0x3000 - 0x3052]

table 7-1 system and IO pad control registers (sheet 1 of 7)

address	register name	default value	R/W	description
0x3000	SYSTEM RESET00	0x30	RW	Reset for Individual Block (0: enable block; 1: reset block) Bit[7]: Reset BIST Bit[6]: Reset MCU program memory Bit[5]: Reset MCU Bit[4]: Reset OTP Bit[3]: Reset STB Bit[2]: Reset d5060 Bit[1]: Reset timing control Bit[0]: Reset array control
0x3001	SYSTEM RESET01	0x08	RW	Reset for Individual Block (0: enable block; 1: reset block) Bit[7]: Reset AWB registers Bit[6]: Reset AFC Bit[5]: Reset ISP Bit[4]: Reset FC Bit[3]: Reset S2P Bit[2]: Reset BLC Bit[1]: Reset AEC registers Bit[0]: Reset AEC
0x3002	SYSTEM RESET02	0x1C	RW	Reset for Individual Block (0: enable block; 1: reset block) Bit[7]: Reset VFIFO Bit[6]: Debug mode Bit[5]: Reset format Bit[4]: Reset JFIFO Bit[3]: Reset SFIFO Bit[2]: Reset JPG Bit[1]: Reset format MUX Bit[0]: Reset average

table 7-1 system and IO pad control registers (sheet 2 of 7)

address	register name	default value	R/W	description
0x3003	SYSTEM RESET03	0x00	RW	Reset for Individual Block (0: enable block; 1: reset block) Bit[7:6]: Debug mode Bit[5]: Reset digital gain compensation Bit[4]: Reset SYNC FIFO Bit[3]: Reset PSRAM Bit[2]: Reset ISP FC Bit[1]: Reset MIPI Bit[0]: Reset DVP
0x3004	CLOCK ENABLE00	0xCF	RW	Clock Enable Control (0: disable clock; 1: enable clock) Bit[7]: Enable BIST clock Bit[6]: Enable MCU program memory clock Bit[5]: Enable MCU clock Bit[4]: Enable OTP clock Bit[3]: Enable STROBE clock Bit[2]: Enable D5060 clock Bit[1]: Enable timing control clock Bit[0]: Enable array control clock
0x3005	CLOCK ENABLE01	0xF7	RW	Clock Enable Control (0: disable clock; 1: enable clock) Bit[7]: Enable AWB register clock Bit[6]: Enable AFC clock Bit[5]: Enable ISP clock Bit[4]: Enable FC clock Bit[3]: Enable S2P clock Bit[2]: Enable BLC clock Bit[1]: Enable AEC register clock Bit[0]: Enable AEC clock
0x3006	CLOCK ENABLE02	0xE3	RW	Clock Enable Control (0: disable clock; 1: enable clock) Bit[7]: Enable PSRAM clock Bit[6]: Enable FMT clock Bit[5]: Enable JPEG 2x clock Bit[3]: Enable JPEG clock Bit[2]: Debug mode Bit[1]: Enable format MUX clock Bit[0]: Enable average clock

table 7-1 system and IO pad control registers (sheet 3 of 7)

address	register name	default value	R/W	description
0x3007	CLOCK ENABLE03	0xFF	RW	Clock Enable Control (0: disable clock; 1: enable clock) Bit[7]: Enable digital gain compensation clock Bit[6]: Enable SYNC FIFO clock Bit[5]: Enable ISPFC SCLK clock Bit[4]: Enable MIPI PCLK clock Bit[3]: Enable MIPI clock Bit[2]: Enable DVP PCLK clock Bit[1]: Enable VFIFO PCLK clock Bit[0]: Enable VFIFO SCLK clock

OV5640

color CMOS QSXGA (5 megapixel) image sensor with OmniBSI™ technology

8 operating specifications

8.1 absolute maximum ratings

table 8-1 absolute maximum ratings

parameter		absolute maximum rating ^a
ambient storage temperature		-40°C to +95°C
supply voltage (with respect to ground) ^b	V _{DD-A}	4.5V
	V _{DD-D}	3V
	V _{DD-IO}	4.5V
electro-static discharge (ESD)	human body model	2000V
	machine model	200V
all input/output voltages (with respect to ground)		-0.3V to V _{DD-IO} + 1V
I/O current on any input or output pin		±200 mA
peak solder temperature (10 second dwell time)		245°C

- a. exceeding the absolute maximum ratings shown above invalidates all AC and DC electrical specifications and may result in permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
- b. for negative voltage with respect to ground, V_{DD-A} (-4.5V), V_{DD-C} (-3V), V_{DD-IO} (-4.5V)

8.2 functional temperature

table 8-2 functional temperature

parameter	range
operating temperature ^a	-30°C to +70°C junction temperature
stable image temperature ^b	0°C to +50°C junction temperature

- a. sensor functions but image quality may be noticeably different at temperatures outside of stable image range
- b. image quality remains stable throughout this temperature range

8.3 DC characteristics

table 8-3 DC characteristics ($-30^{\circ}\text{C} < T_J < 70^{\circ}\text{C}$) (sheet 1 of 2)

symbol	parameter	min	typ	max	unit
power supply					
V_{DD-A}	supply voltage (analog)	2.6	2.8	3.0	V
V_{DD-D}^a	supply voltage (digital core)	1.425	1.5	1.575	V
V_{DD-IO}	supply voltage (digital I/O)	1.71	1.8	3.0	V
internal DVDD short to DVDD, DVP output, AVDD = 2.8V, DOVDD = 2.8V					
I_{DD-A}	operating current		30	40	mA
I_{DD-DO}	2592 x 1944 @ 15 fps JPG		110	140	mA
I_{DD-A}	operating current		30	40	mA
I_{DD-DO}	1080p @ 30 fps JPG		100	130	mA
I_{DD-A}	operating current		32	42	mA
I_{DD-DO}	720p @ 60 fps		100	42	mA
I_{DD-A}	operating current		32	40	mA
I_{DD-DO}	720 @ 30 fps YUV		58	72	mA
I_{DD-A}	operating current		30	40	mA
I_{DD-DO}	VGA @ 30 fps		58	72	mA
internal DVDD, EVDD short to DVDD, MIPI output, AVDD = 2.8V, DOVDD = 1.8V					
I_{DD-A}	operating current		30	40	mA
I_{DD-DO}	2592 x 1944 @ 15 fps JPG		110	140	mA
I_{DD-A}	operating current		30	40	mA
I_{DD-DO}	2592 x 1944 @ 15 fps YUV		100	130	mA
I_{DD-A}	operating current		30	40	mA
I_{DD-DO}	1080p @ 30 fps JPG		100	130	mA
I_{DD-A}	operating current		30	40	mA
I_{DD-DO}	1080p @ 30 fps YUV		90	115	mA
I_{DD-A}	operating current		32	42	mA
I_{DD-DO}	720 @ 30 fps YUV		54	70	mA
external DVDD, EVDD short to DVDD, DVP output, AVDD = 2.8V, DOVDD = 2.8V					
I_{DD-A}	operating current		30	40	mA
I_{DD-D}	2592 x 1944 @ 15 fps JPG		98	125	mA
I_{DD-DO}			9	12	mA

table 8-3 DC characteristics ($-30^{\circ}\text{C} < T_J < 70^{\circ}\text{C}$) (sheet 2 of 2)

symbol	parameter	min	typ	max	unit
standby current					
I _{DDS-SCCB}	standby current ^b		20	50	μA
I _{DDS-PWDN}			20	50	μA
digital inputs (typical conditions: AVDD = 2.8V, DVDD = 1.5V, DOVDD = 1.8V)					
V _{IL}	input voltage LOW			0.54	V
V _{IH}	input voltage HIGH	1.26			V
C _{IN}	input capacitor			10	pF
digital outputs (standard loading 25 pF)					
V _{OH}	output voltage HIGH	1.62			V
V _{OL}	output voltage LOW			0.18	V
serial interface inputs ^c					
V _{IL}	SIOC and SIOD	-0.5	0	0.54	V
V _{IH}	SIOC and SIOD	1.26	1.8	3.0	V

- a. using the internal DVDD regulator is strongly recommended for minimum power down current
- b. standby current is based on room temperature
- c. based on DOVDD = 1.8V.

8.4 AC characteristics

table 8-4 AC characteristics ($T_A = 25^\circ\text{C}$, $V_{DD-A} = 2.8\text{V}$)

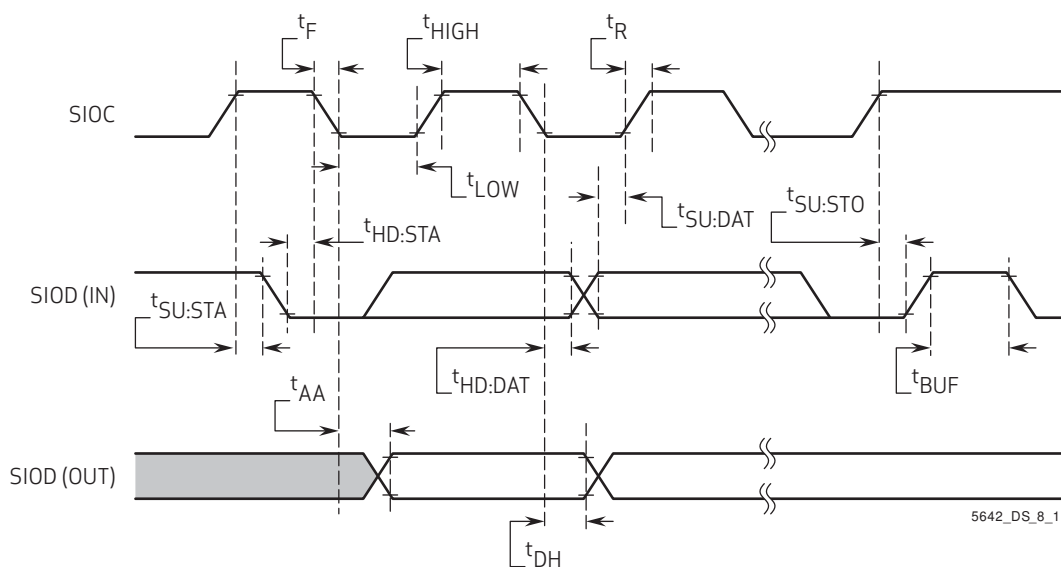

symbol	parameter	min	typ	max	unit
ADC parameters					
B	analog bandwidth		30		MHz
DLE	DC differential linearity error		0.5		LSB
ILE	DC integral linearity error		1		LSB
	settling time for hardware reset			<1	ms
	settling time for software reset			<1	ms
	settling time for resolution mode change			<1	ms
	settling time for register setting			<300	ms

table 8-5 timing characteristics

symbol	parameter	min	typ	max	unit
oscillator and clock input					
f_{OSC}	frequency (XVCLK) ^a	6	24	54	MHz
t_r, t_f	clock input rise/fall time ^b			5 (10 ^c)	ns
f_{PCLK}	parallel port output pixel clock		48 ^d	96 ^e	MHz

- for input clock range 6~27 MHz, the OV5640 can tolerate input clock jitter up to 1ns, for input clock range to 54MHz, the OV5640 can tolerate input clock jitter up to 500 ps
- if the PLL is bypassed, the delay from input clock to output clock is approximately 4~5 ns
- if using the internal PLL
- typical PCLK is 48 MHz when sensor output is smaller size (VGA YUV or below) or full size compression
- 96 MHz is for sensor RAW data output at 15 fps or YUV output at 7.5 fps. For higher speeds such as 5 megapixel YUV @ 15 fps, OmniVision recommends using the MIPI two-lane interface.

figure 8-1 SCCB interface timing

table 8-6 SCCB interface timing specifications^a

symbol	parameter	min	typ	max	unit
f_{SIOC}	clock frequency			400	KHz
t_{LOW}	clock low period	1.3			μs
t_{HIGH}	clock high period	0.6			μs
t_{AA}	SIOC low to data out valid	0.1		0.9	μs
t_{BUF}	bus free time before new start	1.3			μs
$t_{HD:STA}$	start condition hold time	0.6			μs
$t_{SU:STA}$	start condition setup time	0.6			μs
$t_{HD:DAT}$	data in hold time	0			μs
$t_{SU:DAT}$	data in setup time	0.1			μs
$t_{SU:STO}$	stop condition setup time	0.6			μs
t_R, t_F	SCCB rise/fall times			0.3	μs
t_{DH}	data out hold time	0.05			μs

a. SCCB timing is based on 400KHz mode

OV5640

9.2 IR reflow specifications

figure 9-2 IR reflow ramp rate requirements

5640_DS_9_2

table 9-2 reflow conditions

condition	exposure
average ramp-up rate (30°C to 217°C)	less than 3°C per second
> 100°C	between 330 - 600 seconds
> 150°C	at least 210 seconds
> 217°C	at least 30 seconds (30 ~ 120 seconds)
peak temperature	245°C
cool-down rate (peak to 50°C)	less than 6°C per second
time from 30°C to 245°C	no greater than 390 seconds

10 optical specifications

10.1 sensor array center

figure 10-1 sensor array center

note 1 this drawing is not to scale and is for reference only.

note 2 as most optical assemblies invert and mirror the image, the chip is typically mounted with pins A2 to A11 oriented down on the PCB.

5640_CSP_DS_10_1

10.2 lens chief ray angle (CRA)

figure 10-2 chief ray angle (CRA)

table 10-1 CRA versus image height plot (sheet 1 of 2)

field (%)	image height (mm)	CRA (degrees)
0	0	0
0.05	0.114	2.0
0.1	0.227	4.1
0.15	0.341	6.1
0.2	0.454	8.1

0.4	0.908	15.6
0.45	1.022	17.3

table 10-1 CRA versus image height plot (sheet 2 of 2)

field (%)	image height (mm)	CRA (degrees)
0.5	1.135	18.9
0.55	1.249	20.4
0.6	1.362	21.6
0.65	1.476	22.6
0.7	1.589	23.4
0.75	1.703	23.9
0.8	1.816	24.1
0.85	1.930	24.1
0.9	2.043	23.9
0.95	2.157	23.7
1	2.270	23.6

OV5640

color CMOS QSXGA (5 megapixel) image sensor with OmniBSI™ technology

revision history

version 1.0 02.02.2010

- initial release

version 2.0 11.15.2010

- updated datasheet to product specification
- in the key specifications section, updated power requirements from TBD to active: 104 mA; standby: 20 μ A
- in the key specifications section, updated the S/N ratio from TBD to S/N ratio: 36 dB (maximum)
- in the key specifications section, updated the dynamic range from TBD to dynamic range: 68 dB at 8x gain
- in the key specifications section, updated sensitivity from TBD to sensitivity: 600 mV/Lux-sec
- in the key specifications section, removed well capacity
- in the key specifications section, updated dark current from 2 mV/s @ 60°C junction temperature
- in chapter 1, updated table 1-1 signal descriptions
- in chapter 2, updated section 2.7 power up sequence
- in chapter 2, updated section 2.8 reset
- in chapter 2, updated section 2.9 standby and sleep
- in chapter 4, updated table 4-11 OTP control functions by adding footnotes to register 0x3D20~0x3D04
- in chapter 5, updated table 5-2 LENC control registers by adding registers 0x583E, 0x583F, 0x5840 and 0x5841
- in chapter 5, updated table 5-7 CMX control registers by adding registers 0x5380 and 0x5381
- in chapter 6, updated section 6.3 microcontroller unit (MCU) overview
- in chapter 7, updated table 7-1 system and IO pad control registers (registers 0x3030 to 0x3032)
- in chapter 7, removed register table 7-12 BIST registers
- in chapter 7, updated table 7-25 CMX control registers (registers 0x5380 and 0x5381)
- in chapter 8, updated table 8-3 DC characteristics ($-20^{\circ}\text{C} < T_A < 70^{\circ}\text{C}$)
- in chapter 8, updated table 8-6 SCCB interface timing specification

version 2.01 01.20.2011

- in chapter 1, updated table 1-1 signal descriptions

version 2.02 04.11.2011

- in chapter 8, updated table 8-2 operating temperature to -30°C to +70°C junction temperature
- in chapter 8, updated table 8-3 title to DC characteristics (-30°C < T_J < 70°C) and added table footnote c, standby current is based on room temperature

version 2.01 01.20.2011

- in chapter 1, updated table 1-1 signal descriptions

version 2.03 05.26.2011

- in chapter 3, replaced figure 3-2
- in chapter 4, deleted section 4.6.1 auto exposure control (AEC) "In extremely bright situations, the LAEC activates, allowing integration time to be less than one row. In extremely dark situations, the night mode activates, allowing integration time to be larger than one frame."
- in chapter 4, deleted section 4.6.1.1 LAEC "If the integration time is only one row period but the image is too bright, AEC will enter LAEC mode. Within LAEC, the integration time can be further decreased to the minimum of 1/16 row. LAEC ON/OFF can be set in register bit 0x3A00[6]."
- in chapter 4, table 4-4 AEC/AGC control functions, updated 0x3502 register description
- in chapter 7, table 7-5 AEC/AGC control [0x3500 ~ 0x350D], updated 0x3502 register description

OV5640 5-megapixel product brief

available in
a lead-free
package

1/4-inch, 5-Megapixel SOC Image Sensor Optimized for High-Volume Mobile Markets

The OV5640 delivers a complete 5-megapixel camera solution on a single chip, aimed at offering cost efficiencies that serve the high-volume autofocus (AF) camera phone market. The system-on-a-chip (SOC) sensor features OmniVision's 1.4 micron OmniBSI™ backside illumination architecture to deliver excellent pixel performance and best-in-class low-light sensitivity, while enabling ultra compact camera module designs of 8.5 mm x 8.5 mm with <6 mm z-height. The OV5640 provides the full functionality of a complete camera, including anti-shake technology, AF control, and MIPI while being easier to tune than two-chip solutions, making it an ideal choice in terms of cost, time-to-market and ease of platform integration.

The OV5640 enables 720p HD video at 60 frames per second (fps) and 1080p HD video at 30 fps with complete user control over formatting and output data transfer. The 720p/60 HD video is captured in full field of view (FOV) with 2 x 2 binning, which doubles the sensitivity and improves the signal-to-noise ratio (SNR). Additionally, a unique post-binning re-sampling filter function removes zigzag artifacts around slant edges and minimizes spatial artifacts to deliver even sharper, crisper

color images. To further improve camera performance and user experience, the OV5640 features an internal anti-shake engine for image stabilization, and it supports Scalado™ tagging for faster image preview and zoom.

The OV5640 offers a digital video port (DVP) parallel interface and a high-speed dual lane MIPI interface, supporting multiple output formats. An integrated JPEG compression engine simplifies data transfer for bandwidth-limited interfaces. The sensor's automatic image control functions include automatic exposure control (AEC), automatic white balance (AWB), automatic band filter (ABF), 50/60 Hz automatic luminance detection, and automatic black level calibration (ABLC). The OV5640 delivers programmable controls for frame rate, AEC/AGC 16-zone size/position/weight control, mirror and flip, cropping, windowing, and panning. It also offers color saturation, hue, gamma, sharpness (edge enhancement), lens correction, defective pixel canceling, and noise canceling to improve image quality.

Find out more at www.ovt.com.

Applications

- Mobile Phones
- Entertainment
- Digital Still and Video Cameras

Product Features

- 1.4 μm x 1.4 μm pixel with OmniBSI technology for high performance (high sensitivity, low crosstalk, low noise, improved quantum efficiency)
- optical size of 1/4"
- automatic image control functions:
 - automatic exposure control (AEC)
 - automatic white balance (AWB)
 - automatic band filter (ABF)
 - automatic 50/60 Hz luminance detection
 - automatic black level calibration (ABLC)
- programmable controls for frame rate, AEC/AGC 16-zone size/position/weight control, mirror and flip, cropping, windowing, and panning
- image quality controls: color saturation, hue, gamma, sharpness (edge enhancement), lens correction, defective pixel canceling, and noise canceling
- support for output formats: RAW RGB, RGB565/555/444, CCIR656, YUV422/420, YCbCr422, and compression
- support for LED and flash strobe mode
- support for internal and external frame synchronization for frame exposure mode
- support horizontal binning and vertical sub-sampling
- support horizontal binning and vertical sub-sampling
- post binning resampling filter to minimize spatial/aliasing artifacts on 2x2 binned image
- embedded JPEG compression
- support for anti-shake
- digital video port (DVP) parallel output interface and dual lane MIPI output interface
- embedded 1.5V regulator for core power
- programmable I/O drive capability, I/O tri-state configurability
- support for black sun cancellation
- embedded arbitrary scalar supporting any size from 5 MP and below
- auto focus control (AFC) with embedded AF VCM driver
- embedded microcontroller
- suitable for module size of 8.5 x 8.5 x <6mm with both CSP and RW packaging

OV5640

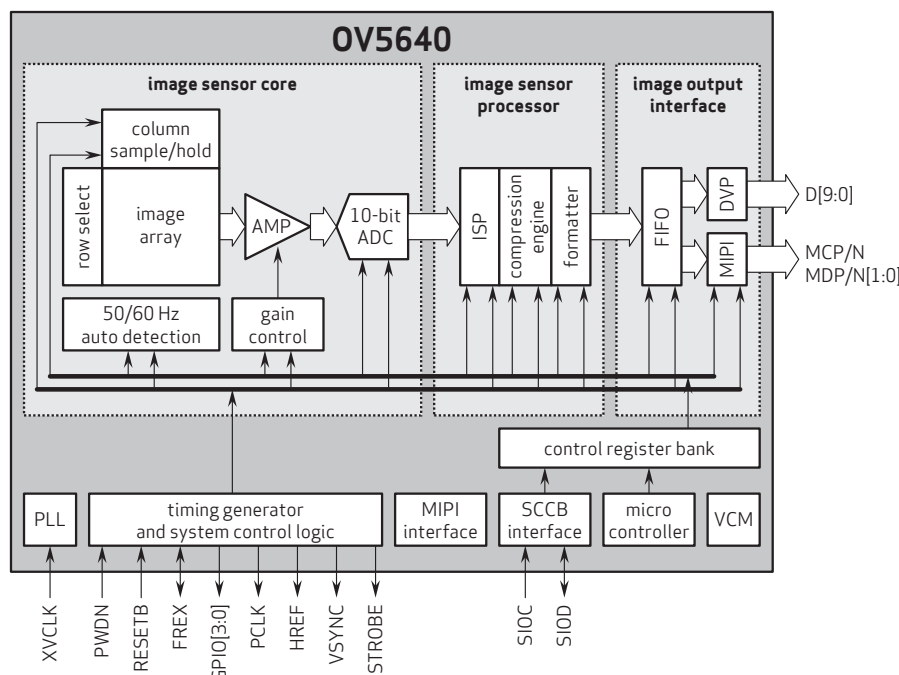

Ordering Information

- **OV5640-A71A**
(color, lead-free, 71-pin CSP3)
- **OV5640-G04A**
(color, chip probing, 200 μm backgrinding, reconstructed wafer)

Product Specifications

- **active array size:** 2592 x 1944
- **power supply:**
 - core: 1.5 V $\pm 5\%$ (with embedded 1.5 V regulator)
 - analog: 2.6 - 3.0 V (2.8 V typical)
 - I/O: 1.8 V / 2.8 V
- **power requirements:**
 - active: 140 mA
 - standby: 20 μA
- **temperature range:**
 - operating: -30°C to 70°C junction temperature
 - stable image: 0°C to 50°C junction temperature
- **output formats:** 8/10-bit RAW RGB output
- **lens size:** 1/4"
- **lens chief ray angle:** 24°
- **input clock frequency:** 6 - 27 MHz
- **shutter:** rolling shutter / frame exposure
- **maximum image transfer rate:**
 - QSGA (2592x1944): 15 fps
 - 1080p: 30 fps
 - 1280 x 960: 45 fps
 - 720p: 60 fps
 - VGA (640x480): 90 fps
 - QVGA (320x240): 120 fps
- **sensitivity:** 600 mV/lux-sec
- **maximum exposure interval:** 1964 x t_{row}
- **max S/N ratio:** 36 dB
- **dynamic range:** 68 dB @ 8x gain
- **pixel size:** 1.4 μm x 1.4 μm
- **dark current:** 8 mV/sec @ 60°C junction temperature
- **image area:** 3673.6 μm x 2738.4 μm
- **package dimensions:**
 - CSP3: 5985 μm x 5835 μm
 - COB: 6000 μm x 5850 μm
